1 Finnish National Vaccination Certificate

The purpose of this specification is to provide necessary information to read, interpret and verify the issued **Finnish National Vaccination Certificates**.

Finnish National Vaccination Certificate contains signed machine-readable data as Aztec code. The data contains person identification information, details of the COVID-19 Vaccination and necessary metadata to identify a valid certificate.

- Person identification information
 - Family name
 - Given name(s) as list
 - Date of Birth
- Information of the vaccine given
 - Manufacturer of the vaccine
 - Administering Centre name where the vaccine was given
 - Lot number of the vaccine
 - Date when the vaccine was given
 - The Number of the vaccine given instance
 - The number of vaccinations to complete the series
 - Name and coding of the disease targeted with the vaccination (ICD-10)
 - Name and coding of the vaccine product given
- Finnish National Vaccination Certificate metadata

Kela

26.5.2021

v1.2

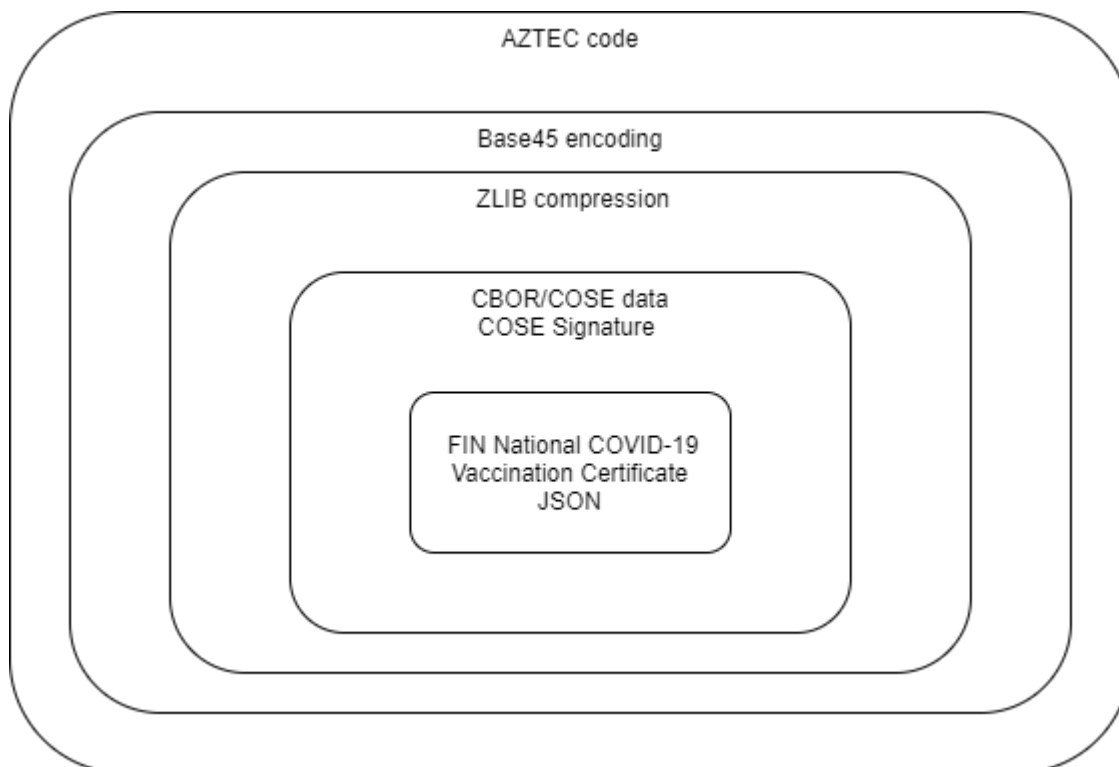

- Issuer of the Certificate
- Validity period of the Finnish National Vaccination Certificate as start end dates
- Finnish National Vaccination Certificate identifier to identify issued Certificates uniquely

The person identification information is needed to enable the matching of the identification of the holder to the information presented in the Vaccination Certificate.

The validity proof is done by signing the machine-readable data with cryptographic signature (ECDSA). The signature of the **Finnish National Vaccination Certificate** uses a public key method to verify. These public keys are made available to the verifiers.

The organization technically issuing **Finnish National Vaccination Certificate** is the Social Insurance Institution of Finland, Kela. The Vaccination information is provided by the Health care unit administering the vaccination.

2 Validating process of the Finnish National Vaccination Certificate

1 Decode process chain.

The process chain to decode and verify Finnish National Vaccination Certificate.

2.1 Read the Aztec code

The Finnish National Vaccination Certificate uses Aztec code as machine-readable data delivery mechanism. Read and store the Aztec code data. The data is in Base45-encoded alphanumeric format.

2-1 Code example: Read Aztec code

```
1#!/usr/bin/env python3
2import sys
3import zxing
4# Read AZTEC code from .png file
5def AztecDecode(filename: str) -> str:
6    # Read AZTEC code from .png file
7    reader = zxing.BarCodeReader()
8    barcode = reader.decode(filename, try_harder = True, possible_formats="AZTEC")
9    return barcode.parsed
10
```

Kela

26.5.2021

v1.2

```
11 def main():
12     filename = sys.argv[1]
13     base45_msg = AztecDecode(filename)
14     print(base45_msg)
15
16 if __name__ == '__main__':
17     main()
18
19 Output Base45 data string:
20 NCFM%G290TK4+S2XIQ%34Z34L0BEY8KPST2M-KM ...
```

2.2 Check the content data format and Decompress the zlib data

The Base45 data contains zlib-compressed data. The zlib data can be identified with magic bytes. The magic bytes can be checked from the first 3 characters of the Base45 encoded text (Base45 encoded is NCF) or after Base45 decode the first 2 bytes of the binary file are hex(78da). Decompress the binary zlib payload to obtain CBOR/COSE binary data.

2-2 Code example: Decode Base45 and zlib decompress

```
1#!/usr/bin/env python3
2import base45
3import sys
4import binascii
5import zlib
6
7# Decode Base45 data to binary
8def decode_data(data: bytes, encoding: str) -> bytes:
9    if encoding == "base45":
10        return base45.b45decode(data)
11
12# Decode and Decompress data to binary
13def decode_and_decompress(data: bytes, encoding: str = "base45") -> bytes:
14    # base45 to binary data
15    decoded_data = decode_data(data, encoding)
16    # decompress binary data
17    # check if the data has zlib magic header 0x78da
18    if binascii.hexlify(decoded_data[:2]).decode() == "78da":
19        uncompressed_data = zlib.decompress(decoded_data)
20    else:
21        raise ValueError("NO valid data found")
22    return uncompressed_data
```

Kela

26.5.2021

v1.2

```
23
24 def main():
25     base45_msg = sys.argv[1]
26     uncompressed_data = decode_and_decompress(bytes(base45_msg))
27     print(binascii.hexlify(uncompressed_data).decode())
28
29 if __name__ == '__main__':
30     main()
31
32 Output COSE message as hex encoded data:
33 d28455a20450653336646664366135643162663635630126a059044 ...
```

2.3 CBOR/COSE

The CBOR/COSE uses cose sign1 structure. The Finnish National Vaccination Certificate uses:

- Protected header
 - Contains alg and kid values
 - alg is CBOR object value -7 (ES256). The algorithm is Elliptic Curve Digital Signature Algorithm (ECDSA) NIST P-256 (secp256r1) in combination of the SHA-256 hash algorithm.
 - kid identifies the signing key. The key identifier (kid) is the first 8 bytes from the SHA-256 fingerprint of the public certificate encoded in DER (raw) hex representation format saved as UTF-8 bytes. Several public keys may be used in parallel by an Issuer when performing key rollovers. The Key Identifier itself not a security-critical field.

2-3 Code example: Key Identifier

```
1 Key Identifier
2 UTF-8 "aa0bbc6ae3464510"
3 bstr "0110 0101 0011 0011 0011 0110 0110 0100 0110 0110 0110 0100 0011 0110 ..."
4 utf-8|hex 61=a |hex 61=a |hex 30=0 |hex 62=b |hex 62=b |hex 33=c |hex 36=6 |...
5
```

Kela

26.5.2021

v1.2

- Payload
 - Contains cbor serialized UTF-8 encoded Json data
- Signature
 - The digital signature of the protected COSE header and payload data

2-4 Code example: Decode CBOR/COSE and verify signature

```
1#!/usr/bin/env python3
2import sys
3import binascii
4import json
5
6from cryptography import x509
7from cryptography.hazmat.primitives import hashes

106     "contained": [
107         {
108 ...
109
110
```

2.4 Check validity of the public certificate

To select the right public certificate, match the Key Identification (kid) to the first 8 bytes of the SHA-256 fingerprint of the public certificate encoded in DER (raw) hex representation format. The data is saved as UTF-8 bytes.

Kela

26.5.2021

v1.2

The openssl command can be used to get the sha256 hash of the der format of the pem certificate:

- `openssl x509 -in <pem filename> -outform der | openssl dgst -sha256`
- The production certificate sha256 fingerprint is:
aa0bbc6ae3464510f533fc8ee753e885098aa5e909684cae29573db134542294

To validate the public certificate check at least the following:

- Issuer:
 - The production certificate Issuer is:
 - Issuer: C = FI, O = Vaestorekisterikeskus CA, OU = Sosiaali- ja terveydenhuollon testipalveluvarmenteet, CN = VRK CA for Social Welfare and Health Care Service Providers
- Validity:
 - Check the validity timeframe of the public certificate
 - Not Before:
 - Not After:
- Subject:
 - In the production public certificate subject is:
 - Subject: C = FI, ST = Finland, L = Helsinki, O = Kansanelakelaitos, OU = Kanta, serialNumber = 1.2.246.556.12.21.1, CN = Todistuspalvelu
 - Revocation status:

Kela

26.5.2021

v1.2

- Check the revocation status of the Certificate
 - OCSP or CRL can be used

If the public certificate does not pass the validity tests, the Finnish National Vaccination Certificate must be considered invalid.

2.5 Check validity of the FIN National Vaccination Certificate

For checking the validity of the **National Vaccination Certificate json data**, the needed metadata is in the json "extension:" structure. The json structure is shown in the **Example Json data**.

The Issuer of the National Vaccination Certificate holds the issuing entity.

- { "valueCodeableConcept" : { "coding" : [{ "code" : "FI", "system" : "urn:iso:std:iso:3166", "display" : "Finland" }] } }
- { "url" : "CertificateIssuer", "valueString" : "Kela" }

The validity period of the National Vaccination Certificate contains start and end times are in Date type ISO 8601 - date part only format. The verifier must check that the current date is in the range (start <= current date >= end). The technical issuing period is 1 year.

- { "url" : "CertificateValidationTime", "valuePeriod" : { "start" : "2021-05-25", "end" : "2022-05-25" } }

If the above issuing entity do not match or the current time is outside of the valid time frame, Vaccination Certificate must be considered invalid.

4 Technology stack

4.1 Aztec code

Finnish National Vaccination Certificate uses Aztec code as machine-readable code to enable verification of the Vaccination Certificate data.

- [ISO - ISO/IEC 24778:2008 - Information technology — Automatic identification and data capture techniques — Aztec Code bar code symbology specification](#)
- [ZXing – opensource.google](#)

4.2 Base45

The data is encoded with Base45 to provide alphanumeric data to Aztec code.

- [draft-faltstrom-base45-04 - The Base45 Data Encoding \(ietf.org\)](#)

4.3 Zlib compression

The data size is minimized with zlib compression.

- [RFC 1950 - ZLIB Compressed Data Format Specification version 3.3 \(ietf.org\)](#)
- [zlib - Wikipedia](#)
- [List of file signatures - Wikipedia](#) search “zlib” for the “magic bytes”

4.4 CBOR/COSE

The Concise Binary Object Representation (CBOR) is used to encode and serialize data to extremely small code size.

- [RFC 8949 - Concise Binary Object Representation \(CBOR\) \(ietf.org\)](#)
- [RFC 8152 - CBOR Object Signing and Encryption \(COSE\) \(ietf.org\)](#)

Kela

26.5.2021

v1.2

4.5 JSON

JavaScript Object Notation (JSON).

- [RFC 8259 - The JavaScript Object Notation \(JSON\) Data Interchange Format \(ietf.org\)](#)

4.6 FHIR

The Finnish National Vaccination Certificate data is in modified Fast Healthcare Interoperability Resources (FHIR) JSON format.

- [Index - FHIR v4.0.1 \(hl7.org\)](#)

4.7 X509v3 Certificate

To verify the validity of Finnish National Vaccination Certificate data, a public certificate to verify the signature is made available from <https://www.kanta.fi> website.

- [RFC 5280 - Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List \(CRL\) Profile \(ietf.org\)](#)

4.8 Elliptic Curve Digital Signature Algorithm

The ECDSA signature with NIST P256 (secp256r1) is used to sign the Finnish National Vaccination Certificate.
